

NIRVANA - AI Wealth Management Platform

Master Specification

Volume 1

Purpose

This document begins the master specification for Nirvana, an AI-powered Personal Financial Operating System. The complete specification will span multiple volumes due to size.

Vision

Nirvana is not a portfolio tracker. It is an AI wealth manager that optimizes wealth creation, protection, growth, intelligent spending, retirement, withdrawal strategy and legacy planning.

Core Modules

Client onboarding, financial profile, goal planning, risk profiling, behavioural finance, wealth health score, investment engine, withdrawal engine, retirement planner, tax optimizer, insurance, loans, credit-card optimizer, estate planning, AI advisor, admin dashboard.

Data Layer

Prototype data providers include Investing.com for market data and Paisabazaar for credit-card information, with Excel as the primary editable datastore and automatic fallback.

Update Data

Admin dashboard includes an Update Data button that refreshes market prices, mutual fund NAVs, ETF prices, gold, bond yields, FD rates, credit card offers, and tax rules before refreshing the normalized database used by the AI.

Architecture

Excel/Live Data -> Validation -> Normalization -> Database -> Deterministic Recommendation Engine -> Optimization Engine -> AI Explanation Layer -> Dashboard.

Differentiator

The Withdrawal Engine recommends exactly how much to withdraw, from which instrument, and in what order to maximize portfolio longevity while minimizing taxes and preserving long-term growth.

Next Volumes: PRD, Design System, Information Architecture, Database Schema, Financial Engines, AI Engine, Backend, Frontend, Admin Panel, Claude Build Prompts.
