

NIRVANA – Master Specification

Volume 2: UI/UX Design System

Design Philosophy

Design Nirvana as a premium private-banking platform. The interface should communicate trust, clarity, precision and confidence. Avoid visual clutter. Every component should reinforce professionalism while remaining approachable.

Visual Identity

Primary palette: deep charcoal backgrounds, white typography, emerald/teal and gold accents for wealth cues, with semantic colors for gains/losses. Use an 8-point spacing system, generous whitespace and subtle glassmorphism only where it improves hierarchy.

Typography

Use a modern sans-serif with clear hierarchy. H1 40-48px, H2 28-32px, H3 20-24px, body 15-16px, captions 12-13px. Numeric values should use tabular figures for financial readability.

Navigation

Left navigation: Dashboard, Clients, Goals, Portfolio, Recommendations, Withdrawal Planner, Credit Cards, Insurance, Loans, Tax, Reports, AI Advisor, Admin. Persistent global search and profile controls.

Dashboard Layout

Top KPIs: Net Worth, Wealth Health Score, Monthly Cash Flow, Goal Progress. Middle: asset allocation, liabilities, retirement probability, AI insights. Bottom: watchlists, market data, notifications and upcoming actions.

Core Components

Cards, data tables, sortable grids, KPI tiles, timeline widgets, accordions, editable forms, upload zones, progress indicators, radar charts, gauges, Sankey cash-flow diagrams and responsive modal dialogs.

Charts

Line charts for performance, donut charts for allocation, stacked bars for goals, radar for health score, heatmaps for spending, waterfall charts for net-worth changes and Monte Carlo probability distributions.

Forms

Multi-step onboarding with autosave, validation, inline help, tooltips and progress tracking. All financial inputs should support currency formatting and contextual guidance.

Responsive Behaviour

Desktop-first with adaptive tablet and mobile layouts. Tables collapse into expandable cards. Charts remain interactive. Navigation becomes a bottom tab bar on mobile.

Accessibility

WCAG-oriented contrast, keyboard navigation, focus states, screen-reader labels, scalable typography and color-independent status indicators.

Microinteractions

Smooth transitions (150-250ms), loading skeletons, optimistic updates, success toasts, AI typing indicators and animated progress during 'Update Data'.

Admin Experience

Dedicated admin dashboard with Upload Excel, Update Data, Sync Status, Provider Health, Logs and Data Source Management (Investing.com, Paisabazaar, Excel fallback).

Design Goal

The application should resemble a premium fintech product comparable in quality to Stripe, Ramp, Mercury or private banking portals while remaining intuitive for first-time users.
