

NIRVANA – Master Specification

Volume 3: Information Architecture & User Flows

Platform Structure

Define the application around three layers: User Experience Layer, Decision Engine Layer and Data Layer. Every recommendation flows through deterministic financial logic before AI explanation.

Primary Navigation

Dashboard, Clients, Onboarding, Portfolio, Goals, Recommendations, Withdrawal Planner, Retirement, Credit Cards, Insurance, Loans, Tax, Reports, AI Advisor, Admin.

Client Journey

Landing → Sign In → Client Creation → Financial Intake → Risk Assessment → Behaviour Assessment → Wealth Health Score → Recommendations → Report → Ongoing Monitoring.

Dashboard Flow

Overview KPIs → AI Insights → Goal Progress → Portfolio Allocation → Cash Flow → Alerts → Recommended Actions → Market Snapshot.

Onboarding Flow

Collect personal details, income, assets, liabilities, expenses, insurance, investments, goals, nominees and documents through autosaved multi-step forms.

Recommendation Flow

Normalize client data → Calculate risk → Score wealth health → Run allocation engine → Tax optimization → Withdrawal logic → AI explanation → Present action plan.

Withdrawal Flow

User selects funding need → System evaluates liquidity, taxes, exit loads and allocation → Returns optimized withdrawal sequence with rationale.

Admin Flow

Upload Excel → Validate → Normalize → Preview Changes → Update Database → Run Update Data → View Logs → Publish.

Reports

Generate PDF reports for wealth review, retirement, tax optimization, portfolio allocation, withdrawal strategy and AI vs Human recommendation comparison.

Permissions

Roles: Client, Advisor, Admin. Each role has scoped access to data, reports, editing and system settings.

Error States

Missing data, provider failure, invalid uploads and calculation errors should present actionable messages and automatic Excel fallback where applicable.

Future Expansion

Architecture should support advisor workspaces, CRM integration, document vault, e-signatures, broker APIs and banking integrations without redesigning navigation.
